SRS10A Series (SRS11A / SRS12A / SRS13A / SRS14A)

Digital Controller

Instruction Manual

Thank you for purchasing a Shimaden Digital Controller. After making sure the product fits the desired description, you should carefully read the instructions and get a good understanding of the contents before attempting to operate the equipment.

Request

The instruction manual should be kept in a handy place where the end user can refer to it when necessary.

Preface

The instruction manual was written for those who perform wiring, installation and routine maintenance for the SRS10A (SRS11A/SRS12A/SRS13A/SRS14A) Series. The instruction manual contains a description of the operating method, functions, wiring, mounting method and precautions when handling the SRS10A (SRS11A/SRS12A/SRS13A/SRS14A) Series (hereinafter referred to as the SRS10A Series unless a separate description is required). You should therefore keep it in a handy place to refer to when operating and handling the equipment. Be sure to observe all precautions and adhere to the procedures provided in the manual. The intsruction manual assumes that fixed value control is applied. For information on programming function and communication (optional items), see the instruction manual for the individual function.

1. Safety rules

Safety rules, precautions concerning equipment damage, additional instructions and notes are written based on the following headings.

 \triangle WARNING: Matters that could result in injury or death if instructions are not followed.

 \triangle CAUTION: Matters that could result in equipment damage if instructions are not followed.

NOTE: Additional instructions or notes.

The SRS10A Series digital controllers are designed to control temperature, humidity and other physical amounts for general industrial equipment.

You should either take appropriate safety measures or avoid using for control that could have a serious effect on human life. The manufacturer shall not be liable for an accident that results if used without taking appropriate safety measures.

- The digital controller should be used so the terminal elements in the control box, etc., are not touched by humans.
- Do not remove the controller from its case, or insert your fingers or electric conductors inside the case. Doing so could result in electric shock or accident involving death or serious injury.

there is danger of damage to any peripheral device or equipment due to failure of the controller, bu should take appropriate safety measures such as mounting a fuse or overheating prevention device. he manufacturer shall not be liable for an accident that results if used without taking appropriate safety measures.
Controller labels and alert mark \triangle Alert marks \triangle are printed on the terminal label of the case. You could be shocked if you touch charged parts. The alert marks are provided to call your attention to this.
Provide a switch or breaker as a means of cutting off power for external power circuit connected to the power terminal of the controller.
Mount a switch or breaker near the controller where the operator can get to it easily and label it as an electrical breaker fo the controller. Use a switch or breaker that conforms to requirements of IEC60947
ese a switch of ofcarel that comornis to requirements of filesos, it.
Fuses The controller does not have a built-in fuse. Be sure to mount a fuse on the power circuit connected to the power terminal. Provide a fuse between the switch or breaker and the controller. Mount on the L side of the power terminal. Fuse rating/characteristics: 250V AC, 0.5A/medium time-lagged type or time-lagged type Use a fuse that conforms to requirements of IEC60127.
Voltage/current of load connected to the output terminal and EV terminal should be within the rating. Using voltage/current that exceeds the rating could shorten the life of the contoller by raising the temperature, and could result in equipment failure. For rating, see "12. Specifications." Connect equipment that conforms to requirements for IEC61010 to the output terminal.
Do not apply voltage/current other than rated input to the input terminal. Doing so could shorten product life and lead to equipment failure. For rating see "12 Specifications"
If the input is voltage or current, connect equipment that conforms to IEC61010 to the input terminal. There are draft holes in the controller for heat to escape from. Do not allow foreign matter such as metal to get into the holes. Doing so could result in equipment failure or fire.
Do not allow the draft holes to become clogged with dust, etc. Doing so could shorten the life of the product due to temperature rise or insulation deterioration, and could result in equipment failure or fire.
Poneoting or durance torte such as dielectric strength noise resistance and surge resistance could respectively offect the controller
Repeating endurance tests such as dielectric strength, horse resistance and surge resistance could negatively affect the controller.
The user should absolutely not modify or use the controller other than the way it was intended.

2-1. Preliminary check

2

The controller has undergone sufficient quality control inspections, but you should check the specification code/appearance and make sure you have all the accessories to make sure nothing is missing or damaged.

Compare the specification code on the case with the following to make sure it is the product you ordered. The SRS10A Series offers a selection of two codes: SRS11A and SRS12A/13A/14A.

(1) Model code check

(SRS11A model code)

SRS11A

8: Multi-input, thermocouple, R.T.D., voltage (mV) 6: Voltage (V)

- Y: Contact I: Current P: SSR drive voltage V: Voltage
- N: None Y: Contact I: Current P: SSR drive voltage V: Voltage
- E: Event output 1 point (EV3) D: External control input 1 point (DI4)
- 90: 100-240V AC 08: 24V AC/DC
- N: None P: With (4 patterns, max. 32 steps)
- 0: None 1: Event output 2 points (EV1, EV2)
- 0: None 3: Voltage (0 ~ 10 mV) 4: Current (4 ~ 20 mA)
- 6: Voltage $(0 \sim 10 \text{ V})$ 5: communication (RS-485)
- 0: None 1: CT 2 points input (Can be selected if control output 1 or 2 is Y, P)
- 2: External control input 3 points (DI1, DI2, DI3) 0: None 9: With

(SRS12A/SRS13A/SRS14A model code)

(2) Accessories check

Instruction manual	1 copy
Communication interface instruction manual (if communication optional item added)	1 copy
Programming function instruction manual (if programming function optional item added) Unit seals	1 copy 1 sheet

Note: Receiving impedance for current input (250Ω, 0.1%), current detector for heater break alarm (CT) and terminal cover are sold separately as optional items and are not included with the controller.

Note: In the event you want to inquire about a product defect, missing accessory or other matter, please contact your nearest Shimaden agent.

2-2. Notes on use

Do not press front panel keys with a hard or pointed object. Press lightly with your fingertips. To clean, wipe lightly with a dry cloth. Do not use solvents such as thinner.

3. Installation and wiring

3-1. Installation site (environmental conditions)

Environmental conditions for operations

The controller is designed to be used under the following conditions. Observe the following environmental conditions when using:

- ① Must be used indoors
- ② Max. elevation: 2000m
- ③ Ambient temperature: -10 to 50°C
- ④ Ambient humidity: Max. 90%RH, no condensation
- ⑤ Transient over voltage category: II
- 6 Pollution class: 2 (IEC 60664)

Do not use the controller in the following locations. Doing so could lead to equipment failure, damage or fire.

- Places exposed to flammable or corrosive gases, oil mist, or excessive dust that could cause insulation to deteriorate.
- Places subject to vibration or impact
- Places near strong electric circuit or places subject to inductive interference
- Places exposed to water dripping or direct sunlight
- Places where the controller is struck directly by air from heater or air conditioner

3-2. Mounting

In order to maintain safety and function, do not remove the case from the controller. If the case of the controller has to be removed for replacement/repair, contact your nearest Shimaden agent.

- ① Cut a hole for mounting the controller in the panel by referring to external dimentions and panel cutout in section 3-3.
- ② The panel thickness should be 1.0 3.5 mm.
- ③ The controller is provided with tabs for mounting. Insert as is from the front surface of the panel.
- ④ Controllers of the SRS10A Series are designed for mounting on the panel. Be sure to mount on the panel.
- (5) If mounted in series, provide ventilation so ambient temperature does not exceed 50°C due to temparature rise caused by heat generation.

3-3. External dimensions and panel cutout

SRS11A

SRS12A

Panel cutout

SRS13A

SRS14A

External dimensions of current detector for heater break alarm (CT)

3-4 Wiring

- Be sure to turn off power before wiring. Failure to do so could result in electric shock.
- After wiring, do not touch terminal elements or other charged parts while conducting electricity. Failure to do so could result in electric shock.

Take the following precautions when wiring:

- ① Wire in accordance with the terminal layout of section 3-5 and the terminal arrangement table of section 3-6. After wiring, check and make sure the wiring is correct.
- ② Crimp-type terminals fit M3 screws. Use crimp-type terminals that are no wider than 6 mm.
- ③ For thermocouple input, use a compensating conductor that matches the type of thermocouple.
- 9 For R.T.D. input, resistance for lead wires should be a maximum of 5 Ω per wire. All 3 wires should have the same resistance.
- ⑤ Input signal wires must not be accommodated with a strong electric circuit in the same conduit or duct.
- [©] Using shielded wiring (single point grounding) is effective for static induction noise.
- ⑦ Making input wiring short and twisting at regular intervals is effective for electromagnetic induction noise.
- Solution For power supply, use wiring or cable with sectional area of at least 1 mm² that offers the same performance as 600V vinyl insulated wiring.
- ⑨ Securely fasten the terminal element screw. Fastening torque: 0.5 N⋅m (5kgf⋅cm)
- If the instrument appears to be easily affected by power supply noise, use a noise filter to prevent malfunctioning. Mount the noise filter on the grounded panel and make the wire connection between the noise filter output and power line terminals of the controller as short as possible.

① Current transformer (CT) connection method (CT input optional)

Pass one of the load lines through the dedicated CT hole. Wire from the CT secondary side terminal to the CT input terminal of the SRS10A Series.

There are 2 combinations of CT connection terminals for the SRS10A Series, which can detect current for 2 heater combinations.

3-5. Terminal layout

Wire in accordance with the following terminal layout and terminal arrangement table.

[+]	Сом	17	9

3-7. Operation preparations

Before operating the controller, you should first check the wiring and carry out the following by screen group setting method. There is however no need to change the settings that have been set at the factory or already been made by the manufacturer.

1. Wiring check

Make sure the wiring to the connection terminals is correct. Incorrect wiring could result in burnout.

2. Power ON

Turn on the operating power. The displays, etc., light when power is supplied to the controller.

3. Measuring range setting

Select code from Measuring Range Codes of "4-58 Measuring range codes setting screen" of 4 screen group and enter. Select temperature unit of "4-59 Input unit setting screen" of 4 screen group and enter. For current, voltage and mV input, set lower limit value, higher limit value and position of decimal point of display contents for input signal.

(You should also select by 4-60, 4-61 and 4-62 screens by code.)

4. Control mode (PID) setting

For ON-OFF (2 position) action, select OFF by "2-1. Output 1 PID1 proportional band setting screen" of 2 screen group and enter. Sets hysteresis by "2-2. Output 1 PID1 hysteresis setting screen." If equipped with output 2, set by same method.

If using auto tuning (AT) with other than ON-OFF hysteresis, this setting operation is not required.

5. Control output characteristics setting

Select RA (for heating) or DA (for cooling) according to output specification (heating/cooling) on "4-45 Output 1 output characteristics setting screen" and "4-48 Output 2 output characteristics setting screen" of 4 screen group and enter.

6. Event type setting

If equipped with event, select types of event on "4-2, 4-7 and 4-12 Event type setting screen" of 4 screen group and enter.

7. Analog output setting

If equipped with analog output, select items to be output as analog signals on "4-23 Analog output type setting screen" of 4 screen group and enter.

8. Precaution concerning initialization by data modification

Modifying measuring range code, type of event or type of analog output initializes related setting values (data). The data must therefore be set again.

4. Names and functions of parts on front panel

5-2. Display when power is applied

When power is applied, the initial screen when power is applied displays each screen for about 1 sec. and switches to the basic screen of screen group 0 as shown in the following figure.

5-11	Series name (5 r 1 1, 5 r 1 2, 5 r 1 3, 5 r 1 4)
ές	Input type (ε ε : thermocouple, ε ε : R.I.D., κε: Voltage [mV], κε: Voltage [V]) (For current mA input, select voltage input after providing receiving impedance of 250Ω externally.)
• out / y	Indicates control output 1 OUT1 output type ('#: Contact, 'P': SSR drive voltage, '#: Voltage, 'E': Current)
outi P	Indicates control output 2 OUT2 output type (9, 9, 8, 2) Displayed if 9, 9, 8, 2 is selected for OUT2.
0.0 800.0	Lower limit value of selected measuring range Higher limit value of selected measuring range
2 5.0	0-0 basic screen, 0 screen group from here Measured value (PV): Switches to screen for setting various functions by operation key from "0-0 basic screen.

5-3. Switching screens

0.0

Within 0 screen: Screen group primarily set by end users.

- Screen group 1: Target set value setting screen group (multi SV).
- Screen group 2: Screen group that sets PID constant.
- Screen group 3: Displayed if equipped with programming function (optional). See "Programming Function Instructions."
- Screen group 4: Screen group primarily set by manufacturer / equipment maker. (Initial setting screen group)

Target set value (SV): For screen sequence, see parameter diagram on previous page.

You can set PV/SV to be displayed or masked by the settings of "4-63. Basic screen display mode."

(1) Switching screens within screen group 0

Each time the \bigcirc key is pressed the screen display switches to the next screen. If pressed when the last screen is displayed, returns to the 0-0 basic screen.

0-	0 Basic scr	een O	-1 Standby sc	reen 0-2 (Output 1 mc	onitoring	0-17 L	atching releas	e screen
	2 5.0	0	2 5.0	C	2 5.0		C	LACH	
	0.0		648	,	° S 0.0			r 5 E 1	
	1	•				•			

(2) Switching between screen group 0 and screen group 1

Pressing the *m* key on the basic screen of screen group 0 switches to "1-0 initial screen" of screen group 1.

Screen gr	oup 0	Screen group 1
0-0 Basic	<u>scre</u> en	1-0 <u>Initial scree</u> n
25.0	lent key	524
0.0	7	588

(3) Switching screens within screen group 1

Each time the \Box key is pressed on the "1-0 initial screen" in screen group 1, the screen display switches to the next screen. If pressed when the last screen is displayed, returns to the "1-0 initial screen."

With screen group 1, each time the RM key is pressed, the screen is switched in the reverse direction.

(4) Switching to screen group 2

Pressing the I key on the "1-0 initial screen" switches to the "2-0 initial screen" of screen group 2.

(5) Switching screens within screen group 2

The "2-0 initial screen" in screen group 2 is the PID1 setting initial screen. Each time the \blacktriangle key is pressed, the setting initial screen switches PID2 \rightarrow PID3 \rightarrow PID1. Pressing the $\boxed{}$ key switches PID1 \rightarrow PID3 \rightarrow PID2.

0 PID1 initial sc	reen		PID2 initial screen	PIE	03 initial scr	een
P[d] 588 ↑∟		V	$\rightarrow \frac{Pid2}{5EE} \leftarrow$	→	<i>P[d3</i> 5EE ▲	

Each time the \Box key is pressed the screen display switches from the various initial screens to the next screen. If pressed when the last screen is displayed, returns to the "2-0 initial screen."

With screen group 2, each time the x key is pressed, the screen is switched in the reverse direction.

(6) Switching to screen group 3

Screen group 2

2

Screen group 3 is the program screen group. It is not displayed unless it is set as an optional item.

Pressing the m key on the "2-0 initial screen" switches to the "3-0 initial screen" of screen group 3. Further pressing the m key switches to the basic screen.

Screen group 0		Screen group 1 S		Screen group 2	Screen group 2	
0-0 Basic screen		1-0 Initial scree	n	2-0 PID Initial s	creen	3-0 Initial screen
2 5.0	ENT	524	ENT	Pidi	ENT	Proū
0.0		588		588		Ptni

For more information on the programming function, see the "Programming Function Instructions."

(7) Switching to screen group 4

Screen group 4 is the initial setting screen group. Various settings are made prior to using the controller. Pressing the \bigcirc key on the basic screen of screen group 0 for at least 3 seconds switches to "4-0 initial screen" of screen group 4. Pressing the \bigcirc key on the "4-0 initial screen" of screen group 4 for at least 3 seconds switches to the basic screen of screen group 0.

S	creen grou	p0 S	Screen group 4		
0	-0 Basic sci	een 4	-0 Initial sci	een	
	2 5.0	🖸 key	init		
	0.0	At least 3 seconds	588		

(8) Switching screens within screen group 4

Each time the \bigcirc key is pressed screen display switches from the initial screens to the next screen. If pressed when the last screen is displayed, returns to the "4-0 initial screen."

With screen group 4, each time the x key is pressed, the screen is switched in the reverse direction.

4-0 Initial scree	n	4-1 screen		4-2 screen
init	0	Lock	C	E1.7
588 3	RUN	oFF ←	RUN	
	RUN			
L		C	• • `	

(9) Set data modification

Data is modified on the various screens by pressing the \blacktriangle or \bigtriangledown key. The modified data is entered by pressing the \blacksquare key.

5-4. Auto return function

If no key operation is conducted for 3 minutes on the various screens (with the exception of the "0-2 output 1 monitoring screen", "0-3 output 2 monitoring screen", "0-4 step No. monitoring screen", "0-5 remaining time of step monitoring screen", "0-6 number of pattern execution monitoring screen", "0-7 Execution PID No. monitoring screen", "0-10 heater current 1 monitoring screen" or "0-11 heater current 2 monitoring screen"), the mode automatically returns to the "0-0 basic screen" of screen group 0 (auto return).

5-5. Screen group 0 setting

The flow is given in "6. Screen description and setting items." This section however primarily contains a description of how to make settings.

As for the key operation method, the \bigcirc key switches to the next screen. The settings are selected with the key or \checkmark key on the various setting screens and entered with the \bowtie key.

Pressing the ar key is however not required for modifying output values on the output monitoring screen for manual adjustment.

(1) Setting target set values (SV)

- 1. To set target set values (SV), press the ▲ key or ▼ key on the "0-0 basic screen." Pressing and holding the key causes the decimal point of the lowest digit to flash, and the value is incremented or decremented. When the desired target set value is reached, enter by pressing the m key.
- 2. When the setting is entered, the decimal point of the lowest digit of the target set value stops flashing. Target values cannot be set while auto tuning (AT) is being executed. To set target values, you must first cancel auto tuning.

Example: Set target set value to 500.0°C.

* If the target set values (SV) are masked in the "4-63. Basic screen display mode," SV values cannot be modified.

(2) Manual setting of control output

0-2

1) Output monitoring screen (OUT1/OUT2) and switching and setting automatic/manual output

To toggle between automatic and manual, press and hold the $\frac{1}{100}$ key on the "0-2 output 1 monitoring screen" or "0-3 output 2 monitoring screen" or press the $\frac{1}{100}$ keys simultaneously.

During manual output, the MAN lamp flashes and it goes off during the automatic output operation.

Pressing the \blacktriangle key or \bigtriangledown key on the output monitoring screen during manual output enables you to set the manual output values. To return to automatic output, press and hold the \square key for 3 seconds or press the \square and \blacktriangle keys simultaneously.

Automatic output Output monitoring so	Manual output creen	Ma	nual output	Autor	natic output
25.0	key 3 seconds 25.0	▲ key	2 5.0	[∎] key 3 seconds	25.0
° 5 0.0	■ + ▲ keys	and b key	o 7 5.0	→ ■ + ▲ keys	°75.0
MAN lamp off	MAN lamp flash	nina MA	N lamp flast	ning	MAN lamp off

① Changing output action of either output 1 or output 2 to manual automatically changes the other to manual. Similarly, changing one to auto also automatically changes the other to automatic as well.

Similarly, changing one to auto also automatically changes the other to automatic as well.

- ② If output of output 1 is 100.0%, **9339** is displayed on the output 1 monitoring screen and the decimal point of **9** flashes.
- ③ If output of output 2 is 100.0%, \bullet **99.9** is displayed on the output 2 monitoring screen and the decimal point of \bullet flashes.
- If output is contact or SSR drive voltage and the proportional band (P) setting is OFF, the output value is 0.0% or 100.0%.
 If output is voltage or current and the proportional band (P) setting is OFF, the output value is the lower limit value or higher
- limit value of the output limiter set.
- NOTE1: Manual output cannot be changed while automatic tuning (AT) is being executed. To change, you must first cancel AT.
- NOTE2: If MAN is selected in "4-28 4-31 DI mode setting screen", external control input has a priority and manual output change cannot be conducted in 0-2 screen.

2) Supplementary explanation for use of manual control output

The correlation of the "0-2 output 1 monitoring screen" and "0-3 output 2 monitoring screen" and automatic/manual output is as follows: ① Output when automatic output is changed to manual is balanceless bumpless action, and the output value prior to change value is displayed.

When manual is changed to automatic, it becomes bumpless action except if measured value (PV) is outside the proportional band. ② If power supply is cut off and turned back on, control output action continues in automatic or manual mode, whichever was set

when the power was shut off. Note: You can switch to another screen in the manual mode as well, but you should note that control output is also manual mode.

When the MAN monitor LED is flashing, the controller is in manual output mode (MAN).

- ③ Manual output (MAN) is canceled if EXE (RUN) is switched to Stby (Rst).
 - MAN operation is possible only in EXE (RUN) mode.

(3) Auto tuning (AT)

Function that automatically processes and sets parameter PID for PID control. Processing time varies according to control.

1) AT execution

Pressing the \blacktriangle key on the "0-15 AT action control screen" causes the $\frown F F$ display at the bottom to change to $\frown n$ and the decimal point of the smallest digit to flash.

Pressing the Err key then executes AT. The decimal point stops flashing and the AT lamp flashes.

When AT is executed, ON/OFF hysteresis of output is repeated several times according to increment or decrement of measured values. The PID value is saved in the internal memory and the action ends. Control based on the PID value in the memory simultaneously starts and the AT lamp stops flashing.

2) Cancellation of AT

To cancel AT before it finishes, select \bigtriangledown with the **\circ** $\not\in$ $\not\in$ key on the "0-15 AT action control screen." When the \blacksquare key is pressed, AT is cancelled. The decimal point and the AT lamp then stop flashing.

3) AT cannot be executed

AT cannot be executed under any of the following conditions:

① Control output is manual. (AT screen not displayed)

- ② Standby (AT screen not displayed)
- ③ Measured value (PV) is scaleover. (AT screen not displayed)
- ④ Control output 1 proportional band (P) is OFF. (AT screen not displayed)
- (5) If lock No. 2 or 3 is set on the key lock screen. (Not possible on AT screen, but possible with DI)
- (6) If AT screen is masked or locked. (Not possible on AT screen, but possible with DI)

4) AT cancellation during execution

AT is canceled during execution under any of the following conditions:

- ① If 200 continuous minutes elapse while output value is 0% or 100%.
- ② When PV is scaleover.
- ③ When switched to standby action.

5) AT action for 2-output specifications

With 2-output specifications, AT action changes according to RA/DA characteristics as follows:

- ① When OUT1/2 characteristics differ (RA/DA or DA/RA) PID constant is same value for both output 1 and output 2.
- ② RA characteristics for both OUT1/OUT2 or DA characteristics for both OUT1/OUT2 AT action is executed for output 1 only; OUT2 during AT execution is 0% output or output limiter lower limit value.
- NOTE: During AT execution, any setting change cannot be conducted except for cancellation of AT, change to standby mode, key rock setting and change of transmission mode.

(4) Standby (STBY) / execution (EXE)

The controller is equipped with a standby mode for temporarily halting controller execution. This operation mode is switched on the "0-1 standby action setting screen." In the case of fixed value control (FIX mode), STBY (standby) / EXE (execution) is displayed. In the case of program control (PROG mode), RST (reset: stop) / RUN (program execution) is displayed. If EXE1 (RUN1) or EXE2 (RUN2) is selected on the "4-28 – 4-31 DI mode setting screen", external control input (DI) is given priority and settings cannot be made on the 0-1 screen.

- ① The RUN lamp is lit green while the controller is operating and it goes off during standby.
- **②** Controller output for standby is 0%.
- ③ When standby is executed, auto tuning (AT) is canceled.
- ④ When standby is executed in the manual input mode, the manual input mode is canceled.
- (5) When the power is turned off while the controller is in standby mode, standby mode continues when the power is turned back on.
- (6) If event standby action is specified when switching to execution mode (EXE) from standby mode (StbY), the specified standby action is executed.
- ⑦ If event latching is not engaged in the standby mode, alarms (Hd, Ld, od, id, HA, LA) are not output.

(5) Event setting

Types of event must be set before setting event values. Modifying the types of event code however initializes setting values (data) related to events.

1) Types of event (alarm type) setting

Select type code from among Hd, Ld, od, id, HA, LA, So, EXE(run), rot1, HC1, HC2, StPS, PtnS, EndS, HoLd, ProG, u_SL, d_SL, GUA on the "4-2 event 1 type setting screen of screen" group 4 with the \blacktriangle key / \checkmark key and enter the event type with the \blacksquare key.

Set event 2 and event 3 on the "4-7 event 2 type setting screen" and "4-12 event 3 type setting screen" in the same manner. The types of event for which event values can be set are the following 6 types:

If an event type code other than the above is selected, event values cannot be set.

2) Event values setting

Event values are set on the "0-12 FIX event 1 setting values setting screen", "0-13 FIX event 2 setting values setting screen" and "0-14 FIX event 3 setting values setting screen." Type of event is displayed when one of the previously mentioned 6 types of events is selected.

Event values are set by selecting setting range by pressing the \blacktriangle key / \checkmark key on the 0-12, 0-13 or 0-14 screen. When the event value setting has been decided, enter by pressing the \square key and the decimal point stops flashing.

Setting range: Higher limit deviation or lower limit deviation Outside or inside higher/lower limit deviation Higher limit absolute value or lower limit absolute value -1999 - 2000 unit 0 - 2000 unit Within measuring range

* Definition of unit Used as a minimum unit for industrial amounts such as °C and %RH. If input temperature range is 0.0 - 200.0, 1 unit = 0.1 °C. If input temperature range is 0 - 1200, 1 unit = 1 °C.

Event values cannot be set during auto tuning (AT) execution. AT must first be canceled.

0-12 FIX event 1 setting values setting screen

(6) Multi SV (target set values)

1) Multi SV

You can set 3 types of target set values (SV). (SV1, SV2, SV3) SV values are set on the "1-3 – 1-5 FIX control SV1 – SV3 setting screen" and execution SV No. is selected on the "1-2 execution SV No. selection screen." PID No. during multi SV is SV1/PID1, SV2/PID2 and SV3/PID3.

2) External selection switching of multi SV

If equipped with external control input DI, if ESV2 is allocated to DI, execution SV can be selected from among SV1 - SV3 by DI input.

Using 2 points of DI, DI to be used for SV selection is allocated on "4-28, 4-29 DI1 and DI2 mode setting screen." ESV2 can be allocated only to DI1 or DI2.

C	Used for compensating input error of sensors, etc. When bias is applied, control is also executed according to the compensated value.	

7. Measuring Range Codes

Select measuring range from the following table.

Changing the code initializes all data related to measuring range.

Input type		Code	Measuring range (°C)	Measuring range (°F)	
		В	0 / *1	0 ~ 1800 °C	$0 \sim 3300 \ ^\circ F$
		R	50	0 ∼ 1700 °C	0 ~ 3100 °F
		S	03	0 ~ 1700 °C	$0 \sim 3100 \ ^\circ F$
			ü 4 *2	-199.9 ~ 400.0 °C	-300 ~ 750 °F
	ø	K	05	0.0 ~ 800.0 °C	$0 \sim 1500 ^{\circ}\mathrm{F}$

*6. Thermocouple	K (Kelvin) accuracy	*7. Thermocouple	Metal-chromel (AuFe-Cr) (Kelvin) accuracy
Temperature range		Temperature	e range
10.0 ~ 30.0 K	$\pm (2.0\%FS + [CJ error \times 20] K + 1K)$	0.0 ~ 30.0 K	$\pm (0.7\%$ FS + [CJ error × 3] K + 1K)
$30.0 \sim 70.0 \text{ K}$	$\pm (1.0\%$ FS + [CJ error × 7] K + 1K)	30.0 ~ 70.0 K	$\pm (0.5\%$ FS + [CJ error $\times 1.5$] K + 1K)
70.0 ~ 170.0 K	$\pm (0.7\%$ FS + [CJ error × 3] K + 1K)	70.0 ~ 170.0 K	$\pm (0.3\%FS + [CJ error \times 1.2] K + 1K)$
$170.0 \sim 270.0 \text{ K}$	$\pm (0.5\%FS + [CJ error \times 1.5] K + 1K)$	170.0 ~ 280.0 K	$\pm (0.3\%$ FS + [CJ error \times 1] K + 1K)
270.0 ~ 350.0 K	$\pm (0.3\%FS + [CJ error \times 1] K + 1K)$	280.0 ~ 350.0 K	$\pm (0.5\%FS + [CJ error \times 1] K + 1K)$

NOTE: Unless otherwise specified, the measuring range will be set as follows when shipped from the factory:

Input	Standard/rating	Measuring range	
Multi input	K thermocouple	$0.0 \sim 800.0^{\circ}C$	
Voltage (V)	$0 \sim 10 V DC$	0.0 ~ 100.0, no unit	

8. Explanation of functions

This section contains a description of operation not covered in "5-5. Screen group 0 setting."

8-1. Events

(1) Alarm action

1) Deviation alarm

Sets alarm action points for deviation of measured values (PV) from target set values (SV).

For example, to trigger an alarm when measured value (PV) of 30°C or more when target set value is 20°C, the higher limit deviation alarm is set to 10°C.

Or to trigger an alarm when measured value (PV) of 30°C or less when target set value is 100°C, the lower limit deviation alarm is set to -70°C.

This is convenient if you want alarm action point to be in accordance with deviation from target set values. The setting range is -1999 - 2000 unit.

2) Absolute value alarm

Sets alarm action point by absolute value. Higher limit absolute value alarm and lower limit absolute value alarm can be set at any point within measuring range.

For example, to trigger an alarm when measured value reaches 50°C or higher, set the higher limit absolute value alarm to 50°C. Or to trigger an alarm when measured value reaches 20°C or lower, set the lower limit absolute value alarm to 20°C.

3) Standby action

If event standby action is set to 1 (or 2), when power is applied, an event is not output even if the measured value is in the alarm action area (ON area) for target setting value change or standby cancel.

Once outside the alarm action area (OFF area) and standby action is canceled, an event is output when it once again enters the alarm action area.

4) Non-standby action

If event standby action is set to OFF and 3, an event is always output when the measured value is within the alarm action area.

5) Control mode

If standby action is set to 3, alarm is not triggered during scaleover.

(2) Event standby action selection

The following are supplementary explanations of operation with "4-4, 4-9 and 4-14 event code standby action setting screen" of screen group 4.

① If using event output as an alarm, set from 1 or 2 of standby action code table.

② If using event output for control, set 3 (control mode). If 3 is set, however, event output remains OFF for abnormal input.

③ If set to 1, standby action functions when power is applied or standby is cancelled.

④ If set to 2, standby action functions when power is applied, when standby is canceled and when execution SV is changed.
• NOTE1: Standby action is canceled immediately if changed to OFF or 3 during standby action.

NOTE2: During scaleover, standby action is canceled.

(3) Event selection alarm action diagrams

The following are alarm action diagrams for selecting event (EV1/EV2/EV3).

- Δ : SV value
 - A: Alarm action point setting value

L d: Lower limit deviation alarm

5 a : Scaleover

-10%

H R : Higher limit absolute value alarm ↓ *R* : Lower limit absolute value alarm

Action ON

(4) Output 1 inverted output

If equipped with contact output 1, inverted output can be executed for output 1 by selecting **r c k i** (output 1 inverted output) for the event code. Output is however OFF for both output 1 and event when the power is off.

(5) Event status output action

① E ፞ E	EXE signal	Fixed value control (FIX mode) output during control action.
2run	RUN signal	Output during program execution during program control.
3 H[HC1	Output during alarm action of either heater 1 break/loop.
4 H [Z	HC2	Output during alarm action of either heater 2 break/loop.
5 5 t P 5	STPS	Step signal Ouput for 1 second each time step in program control execution is completed.
6 Pt n 5	PTNS	Pattern signal Ouput for 1 second each time pattern in program control execution is completed.
0End5	ENDS	Program end signal Output for 1 second when program control execution is completed.
		(Output even if program is forcibly completed halfway.)
8 Hald	HOLD	Hold signal Output when holding (temporary halt of program) during program control.
9 Prol	PROG	Program signal Output when set to program mode.
10 u . 5 L	U SL	Up slope signal Output during up slope step execution during program control.
1 0 51	DSL	Down slope signal Output during down slope step execution during program control.
	GŪA	Guarantee soak signal Output when guarantee soak is engaged.

8-2. Heater break/loop alarm

Heater break/loop alarm can be used only in control output Y (contact) or P (SSR drive voltage output).

Heater break/loop alarm becomes effective if CT input or event output is equipped.

Heater break alarm outputs an alarm if the current value detected by CT when control output is ON is lower than the setting. Heater loop alarm also outputs an alarm if the current value detected by CT when control output is OFF is higher than the setting. In the SRS10A series, 2 points of CT input is equipped if the CT input option is selected.

Any break of 2 heating stages control heater or three-phase heater can be detected by using two CT.

8-3. P.I.D.

(1) P (Proportional action)

Sets percentage at which control output varies for measuring range. The size of control output varies according to ratio of PV value to SV value.

Slight proportional band variation results in strong proportional action. If it is too slight, control vibrates and the results of control are similar to ON-OFF action.

(2) I (Integral time)

Function that corrects offset (constant deviation) produced by proportional band. The longer the integral time, the weaker the corrective action and the shorter the time, the stronger the action is, but control may vibrate due to integral hunting.

(3) D (Derivative time)

Enhances stability by estimating change in control output and suppressing integral overshoot. The longer the derivative time, the stronger derivative action is, but control results may be similar to vibration.

(4) MR (Manual reset)

With PID action "I" is automatically offset, but if "I" is OFF, it is not offset. If so, it can be offset by manually increasing/ decreasing output. This is called "manual reset."

(5) SF (Target value function)

This function determines the strength of the overshoot preventing function when operating expert PID. Expert PID suppresses overshoot by conducting operation for predicting and canceling the amount of overshoot by referring to the PID value and the variation of PV value when it reached the targeted setting value (SV) (or the proportional band). Target value function is effective only when there is an integral operation (PI, PID operation).

SF= OFF: Expert PID does not function and normal PID operates.

SF= 1.00: Minimize overshoot for expert PID contronl.

 $SF \rightarrow Small$: Overshoot preventing function works limitedly.

SF \rightarrow Large: Overshoot preventing function works fully.

8-4. Control output

(1) Lower limit and higher limit limiter setting

- ① Output limiter limits minimum and maximum values of control output and helps securing minimum temperature and suppress control overshoot.
- ② Lower limit value is given priority for output limiter setting. If minimum value is set above the higher limit value, the higher limit value forcibly becomes the lower limit value + 1%. Higher limit value cannot be set less than lower limit value + 1%.

(2) Proportional cycling time

The correlation between proportional cycling time and control output are as shown in the following figure.

(3) Control output characteristics

Control output characteristics can be set independently for output 1 and output 2. For heating, set to RA (reverse action) and for cooling set to DA (direct action).

Output characteristics

Control output with 2-output characteristics is as shown in the following figure. ① is heating/cooling control and ② is heat + heat control.

①2-output heating/cooling action output characteristics

22-output heating/cooling action output characteristics

 Δ : Target set values (SV) Δ : DB (dead band) Dead band: Shifts proportional band of control output2 for setting value.

8-5. External control input (DI)

Input must be retained for at least 250 ms to receive external control input of the SRS10A Series. Assignment by DI input is conducted on the "4-28 – 4-31 DI mode setting screens." Function assigned to DI cannot be conducted by key operation. (DI input is prioritized.) However, AT and unlatching can be conducted by key operation even if assigned to DI.

(1) Controller action execution EXE1 (RUN1)

You can toggle between controller action execution/stop. Level action.

DI input OFF: Switches to standby (reset). SRS10A stops action. DI input ON: Controller action is executed. PID operation control is executed (program control execution).

• NOTE: If DI is ON when power is applied, controller action is executed immediately after power is applied.

(2) Controller action execution EXE2 (RUN2)

Execution/stop is switched each time DI input is turned ON. (edge action).

NOTE: If DI is ON when power is applied, controller action is not executed immediately after power is applied.

(3) Manual output (MAN)

Switches to manual output. Level action.

DI input OFF: Ordinary feedback control action is executed. DI input ON: Control output is executed manually; feedback control is not executed.

(4) Auto tuning execution (AT)

Auto tuning can be executed from outside. Edge action.

Once DI input is turned ON, auto tuning is executed.

If SV No. is switched by DI during AT execution, it is not applied until AT is finished.

AT in execution cannot be released by DI. Front key is used for releasing AT in execution (0-15 screen).

(5) SV external selection (ESV2)

Setting values of SV1 - SV3 can be switched to SV being executed. DI is level action using 2 points. Assignment to DI1 or DI2 can be set. Assigning/setting SV external selection to DI1 automatically allocates it to DI2 as well, so DI2 cannot be selected. Assigning/setting SV external selection to DI2 automatically allocates it to DI3 as well, so DI3 cannot be selected.

When assigned to DI1

When assigned to DI1				When a	ssigned to	o DI2
DI2	DI1	Selected SV No.		DI3	DI2	Selected SV No.
0	0	1		0	0	1
0	1	1		0	1	1
1	0	2		1	0	2
1	1	3		1	1	3

SV No. and PID No. being executed correspond to SV1/PID1, SV2/PID2, and SV3/PID3.

(6) Output 1 output characteristic (ACT1)

Switches output characteristics of control output 1 (RA/DA). : RA (heating) When DI input OFF When DI input ON : DA (cooling)

(7) Output 2 output characteristic (ACT2)

Switches output characteristics of control output 2 (RA/DA). When DI input OFF RA (heating) : When DI input ON : DA (cooling)

(8) Program (PROG)

You can switch FIX(fixed value control) and PROG(program) mode. Level action.

DI input OFF: FIX (fixed value control) mode DI input ON: Program (PROG) mode

(9) Hold signal (HLD)

Program execution can be halted from outside. Level action. DI input ON: Stops program step time.

(10) Advance (ADV)

Edge action.

During program control execution, once DI input is turned ON, the current step is completed, and operation forcibly advances to the next step.

(11) Start pattern external selection 2 bits (PTN2)

You can select the program start pattern. DI is level action using 2 points. Assignment to DI1 or DI2 can be set. Assigning/setting start pattern selection to DI1 automatically assigns it to DI2 as well, so DI2 cannot be selected. Assigning/setting start pattern selection to DI2 automatically assigns it to DI3 as well, so DI3 cannot be selected.

When assigned to DI1			When as	signed to l	DI2	
DI2	DI1	Start pattern No.	DI3	DI2	Start pattern No.]
0	0	1	0	0	1	Start pattern No.2 is executed if
0	1	1	0	1	1	start pattern No.3 is selected
1	0	2	1	0	2	and number of pattern is set to 2
1	1	3	1	1	3	on 4-52 screen.

28

(12) Start pattern external selection 3 bits (PTN3)

You can select the program start pattern. DI is level action using 3 points; only DI1 can be assigned/set. Assigning/setting start pattern selection 3 bits to DI1 automatically assigns it to DI2 and DI3 as well, so DI2 and DI3 cannot be selected.

DI3	DI2	DI1	Start pattern No.	
0	0	0	1	
0	0	1	1	* SPT No. 4 regardless of ON/OFF.
0	1	0	2	Start pattern No.2 is executed if start pattern No.3 or
0	1	1	3	No.4 is selected and number of pattern is set to 2 on
1	0	0	4	4-52 screen.
1	*	*	4	

(13) Total unlatching (L_RS)

Events can be unlatched from outside. Edge action.

Once DI is turned ON, all event output is unlatched. Event output is however not unlatched if event output conditions have been satisfied.

8-6. Soft start

Soft start is a function that gradually increases control output by set time when power is applied, standby is canceled and operation is normally reset from scaleover. It is effective for preventing excessive current from being supplied to the heater, etc.

(1) Conditions that trigger soft start

- ① When power is applied in the automatic output mode, standby is canceled or normal reset from scaleover.
- (2) When P (proportional band) is other than OFF on "2-1, 2-9 proportional band setting screen."
- ③ When soft start time setting on "4-47, 4-50 soft start time setting screen" is not OFF.

(2) Conditions that cancel soft start

- ① When soft start time has elapsed normally.
- ② When output values of soft start are higher than PID operation output values.
- ③ When soft start time is changed to OFF.
- ④ When switched to manual mode.
- (5) When AT (auto tuning) is executed.
- ⁽⁶⁾ When P (proportional band) is changed to OFF.
- ⑦ When control output characteristics are changed.
- (8) When in standby mode.

8-7. Change in position of decimal point

Position of decimal point can be changed for linear input, TC of decimal point and RTD range. You should keep in mind that operation differs for TC and RTD range when using linear input.

(1) Change in position of decimal point for linear input

Sets position of decimal point to be displayed.

If changing position of decimal point from 0.0 to 0.000, input scaling changes from 0.0 - 100.0 to 0.000 - 1.000.

(2) Change in position of decimal point of TC/RTD range

: #5# (DI/1:)

Display of places below the decimal point can be switched to display or mask. If changing position of decimal point from 0.0 to 0, the places below the decimal point are rounded off before being masked. If changing position of decimal point from 0 to 0.0, the places below the decimal point are displayed again.

Things requiring special attention

1 10

• Parameter values affected by range change (UNIT) also change similarly.

Example: If range is "5" (PV blas)						
	[Position of decimal point: 0.0] -	\rightarrow Change \rightarrow [Position of decimal point: 0] \rightarrow C	Change again \rightarrow [Position of decimal point: 0.0]			
Measuring range lower limit value	0.0	0	0.0			
Measuring range higher limit value	800.0	800	800.0			
PV bias	20.5	21	21.0			

- * As described above, after changing the position of the decimal point, the value may not revert to the original value when the position of the decimal point is changed back.
- When measurement range is changed, the position of the decimal point returns to the default position.
- If position of decimal point is 0, display accuracy is not guaranteed.

9. Causes and remedy of trouble and errors

9-1. Causes and remedy of trouble

Problem	Cause	Remedy
 Error message is displayed. 	See "Causes and remedy of errors."	See "Error Codes, Causes and Remedies."
② Displayed measured value (PV) seems to be incorrect.	 ① Set measuring range code is different from that of input sensor / input signal. ② Erroneous wiring to input terminals of sensor. 	 ① Check if set measuring range code is correct for input signal. ② Cortect wiring to input terminals of sensor.
③ Front panel display goes off and does not function.	 Problem with power supply and/or wiring connection. Something is wrong with the instrument. 	 ① Inspect power supply / wiring connections and check wiring. ② Inspect, repair or replace the instrument.
④ Keys do not work.	 Key lock is in effect. Communication is set to Com during communication. Something is wrong with the instrument. 	 Cancel key lock. Set communication to local (Loc). Inspect, repair or replace the instrument.
③ ON-OFF action of control output is too fast.	① ON-OFF "hysteresis range" is too narrow.	① Widen ON-OFF "hysteresis range."

9-2. Causes and remedy of errors (1) Abnormal measured input

Screen display	Problem	Cause	Remedy
нннн)	Higher limit scaleover	 Break in thermocouple input wiring. Break in R.T.D. input A wiring. Input measured value exceeded higher limit of measuring range by 10%. 	 Check thermocouple input wiring for possible break. If there is nothing wrong with wiring, replace thermocouple. Check R.T.D. input A terminal wiring for possible break. If there is nothing wrong with wiring, replace R.T.D. For voltage or current input, check the measurement signal transmission unit. Check if set measuring range code is correct for input signal.
LLLLL)	Lower limit scaleover	Input measured value fell below lower limit of measuring range by 10%.	Check for measurement input wiring for reverse polarity or possible break.
b (b)	Break in R.T.D. input wiring	 Break in B wiring Multiple break in ABB wiring 	Check R.T.D. input ABB terminal wiring for possible break. If there is nothing wrong with wiring, replace R.T.D.
С ЈИН (СЈНН)	Higher limit scaleover of cold junction (CJ) of thermocouple input	Ambient temperature has exceeded 80°C.	 ⑦ Reduce ambient temperature to the level provided in the environment conditions for the product. ⑦ If ambient temperature has not exceeded 80°C, examine the controller.
CJLL)	Lower limit scaleover of cold junction (CJ) of thermocouple input	Ambient temperature has fallen below -20°C.	 ① Raise ambient temperature to the level provided in the environment conditions for the product. ② If ambient temperature has not fallen below -20°C, examine the controller.

(2) Heater break/loop alarm errors

Screen display	Problem	Cause	Remedy
кькк	Heater current sensor CT input value has	Excessive current	① Reduce the current.
(HbHH)	exceeded 55.0A.		② Inspect the controller.
HBLL	Something is wrong with the instrument.	Something is wrong with the	Inspect, repair or replace the instrument.
(HbLL)		instrument.	

When the controller does not operate as intended and you suspect it may be broken, read the instruction manual and inspect once again. If there is something wrong with the controller or there is something you do not understand, contact your nearest Shimaden dealer.

10-1. Overview

Mask or key lock can be set for the various parameters.

The factory setting is "all disp" (display).

There are however limits, so you should keep this point in mind.

- <Note>
- PID-related parameter are managed by 1 set of PID No. 1 to No. 3.
- Example) If output 1 proportional band is changed, output 1 proportional band is similarly changed for PID No. 1 to No. 3. • Pattern-related parameters are managed by 1 set of pattern 1 to pattern 4.
- Example) If the start SV value setting is changed, the start SV value is similarly changed for pattern 1 to pattern 4. • Step-related parameters are managed by 1 set of all steps.
- Example) If the step SV value setting is changed, all steps of step SV value are similarly changed for pattern 1 to pattern 4. • The settings cannot be changed for the various monitor screen of the user setting screen group. Always displayed.
- The settings cannot be changed for the EXE/STBY (RUN/RST) switching screen of the user setting screen group.
- Always displayed.
- The "dp" in the far right digit of the SV display lights when ordinary parameter settings screen is displayed for locked parameters.
- If turned from OFF to ON on the M0-1 screen, the mask/lock setting of all parameters is reset to "disp" (display).

Please note that the function of each parameter is still valid even in masked/locked state by mask/lock function and can be operated by communication or DI.

10-1. Parameter diagram

The overview of the parameter mask/lock diagram is as follows. The windows of the various screens are divided as follows. The number at the top of the window is the screen No.

To switch to the mask/lock setting mode, press and hold in the "4-0 INIT screen" for at least 2 seconds when on standby (reset).

Screen	always displayed by key operati	on, etc.	Screen displayed when concerned optional item is added

10-2. Mask/lock setting contents

(1) Settings for various parameters

- **d** $\overline{\mathbf{5}}$ $\overline{\mathbf{9}}$: Displays parameter setting screen.
- **ARS**: Masks parameter setting screen.
- Loc *H*: Displays parameter setting screen but keys are locked.
 - The "dp" on the far right of the SV display lights to indicate key lock.

(2) Settings for each screen group

d 5 **P**. Setting **d** 5 **P** on the M1-0, M2-0, M3-0, M4-0 screens displays the target screen group.

- Setting contents for the various parameters are applied.
- **ARSP**: Setting **ARSP** on the M1-0, M2-0, M3-0, M4-0 screens masks the target screen group.
 - Setting $\vec{A} \vec{B} \vec{S} \vec{F}$ on the M1-0 screen masks the M1-1 M1-5 and 1 screen group.
 - Setting **A R 5 H** on the M2-0 screen masks the M2-1 M2-16 and 2 screen group.
 - Setting **775** on the M3-0 screen masks the M3-1 M3-12 and 3 screen group.
 - Setting **A 5 H** on the M4-0 screen masks the M4-1 M4-63 and 4 screen group.
- Loc *P*: Setting Loc *P* on the M1-0, M2-0, M3-0, M4-0 screens locks the keys of the target screen group. Parameters set to **ABS***P* are masked and parameters set to **dCS***P* / **LOC***P* are displayed but the keys are locked.

(3) Mask/lock initialization

If turned from OFF to ON on the M0-1 all parameters reset screen, mask/lock is reset for all parameter and becomes d 5 P.

For the sake of convenience, you should record your settings and selections. Initial values for code 05 (K) are given here.
